

# Introduction to

# Overview

1. The ABINIT software project
2. ABINIT basics
  - Plane waves
  - Sampling the Brillouin Zone
  - Pseudopotentials / PAW
3. Running ABINIT : basics
4. HPC computing

# ABINIT software project

Ideas (1997) – pioneered by **Xavier Gonze** :

- 1) Software for first-principles simulations are more and more complex : needs a worldwide collaboration, of specialized, complementary, groups
- 2) Linux software development : ‘free software’ model

Now (2026) :

> 1 200 000 lines of F90  
> 50 python scripts  
about 60 contributors to ABINITv8/v9/v10

Last release 10.4  
very soon 10.6,  
<http://www.abinit.org>

Available freely  
(GPL, like Linux).

# ABINIT v10 capabilities (I)

## Methodologies

Pseudopotentials/Plane Waves

+ Projector Augmented Waves (for selected capabilities)

Many pseudopotential types, different PAW generators

Density functionals :

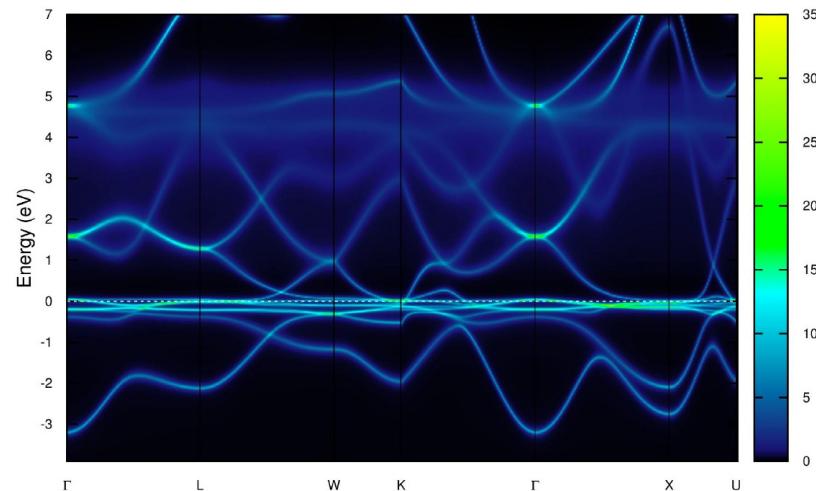

- LDA
- GGA (PBE and variations, HCTH, ...),
- LDA+U (or GGA+U)
- hybrid functionals + ...

LR-TDDFT for finite systems excitations

GW for accurate electronic eigenenergies

Bethe-Salpeter for accurate optical properties

Dynamical mean field-theory (DMFT)

alpha-Cerium from DMFT

# ABINIT v10 capabilities (II)

Forces, stresses, optimisation of atomic positions and unit cell parameters  
(Broyden and Molecular dynamics with damping)

Collinear spin / non-collinear spin / spin-orbit coupling

Molecular dynamics, Nosé thermostat, Langevin dynamics

Path-Integral Molecular Dynamics, String / NEB method for saddle points

Susceptibility matrix by sum over states

Optical (linear + non-linear) spectra

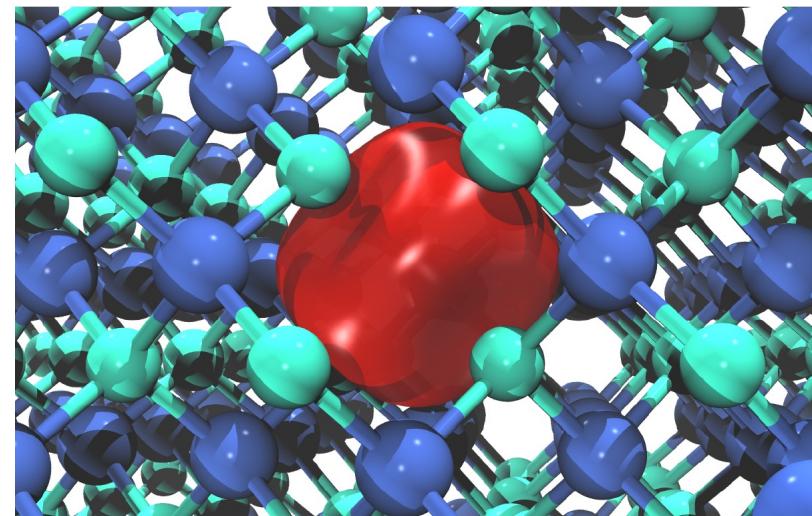

Polarization, finite electric field

Electric field gradients

Positron lifetime

Symmetry analyser

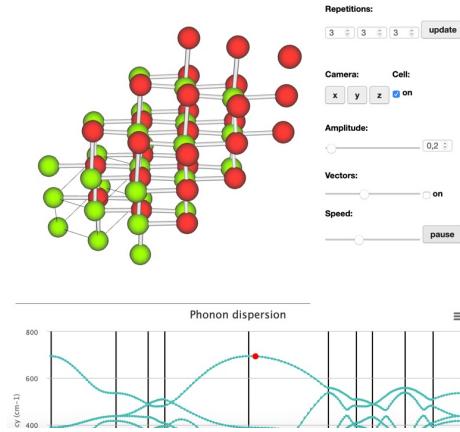

(database of 230 spatial groups + 1191 Shubnikov magnetic groups)

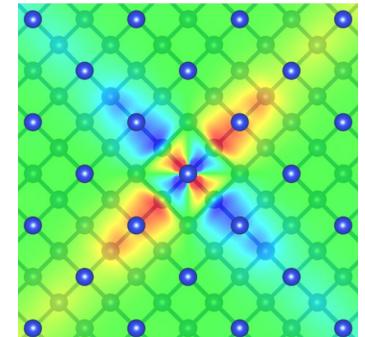

# ABINIT v10 capabilities (III)

Density-Functional Perturbation Theory (DFPT) :

- Responses to **atomic displacements**, to static homogeneous electric&magnetic field, to strain, to long-wave perturbations

- Second-order derivatives of the energy, giving direct access to : dynamical matrices at any  $q$ , **phonon frequencies**, force constants ; **phonon DOS**, thermodynamic properties (quasi-harmonic approximation) ; dielectric tensor, Born effective charges, dynamical quadrupoles ; elastic constants, internal strain ... ; piezoelectric tensor, flexoelectric tensor ... ,
- Matrix elements, giving direct access to : **electron-phonon coupling** (mobility, Seebeck, superconductivity) **temperature-dependence of the electronic structure**
- Non-linear responses thanks to the  $2n+1$  theorem - at present : non-linear dielectric susceptibility; Raman cross-section ; electro-optic tensor

# Quality control : test suite + test farm

How to secure existing capabilities despite the development efforts (by diverse groups) and associated bug generation ?

Test suite : >1200 automatic tests (+ new added for each capability)

Test farm : 7 active servers (12 to 96 cores)

with 4 compilers (gfort, Intel, NAG, NVhpc) => over 20 ‘builders’

# Basic Documentation

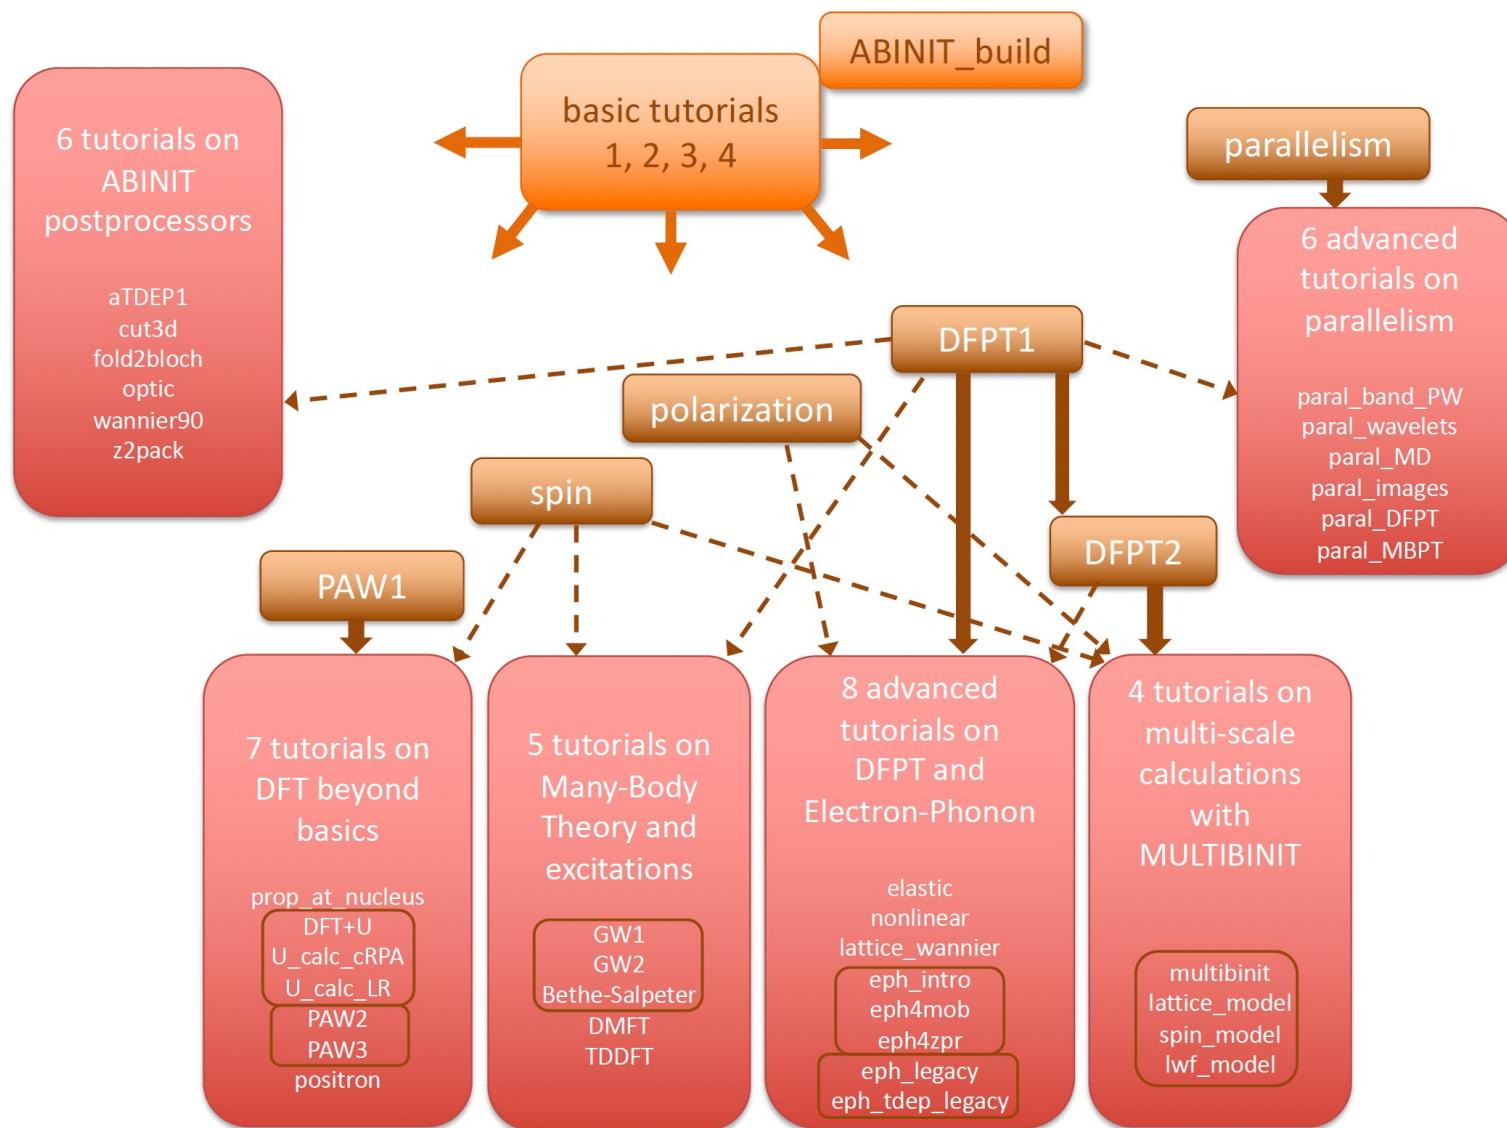

Web site <http://www.abinit.org> ; <http://docs.abinit.org>

- User's guides
- Installations notes
- List of input variables + description
- List of topics = a hub to input variables, files, tutorial, brefs
- Over 1000 example input files
- >30 tutorial lessons (each 1-2 hours)  
<https://docs.abinit.org/tutorial>

+ Forum Web site <https://discourse.abinit.org>

(old forum <http://forum.abinit.org> with more than 2000 registered members)

# ABINIT tutorial : layout + dependencies

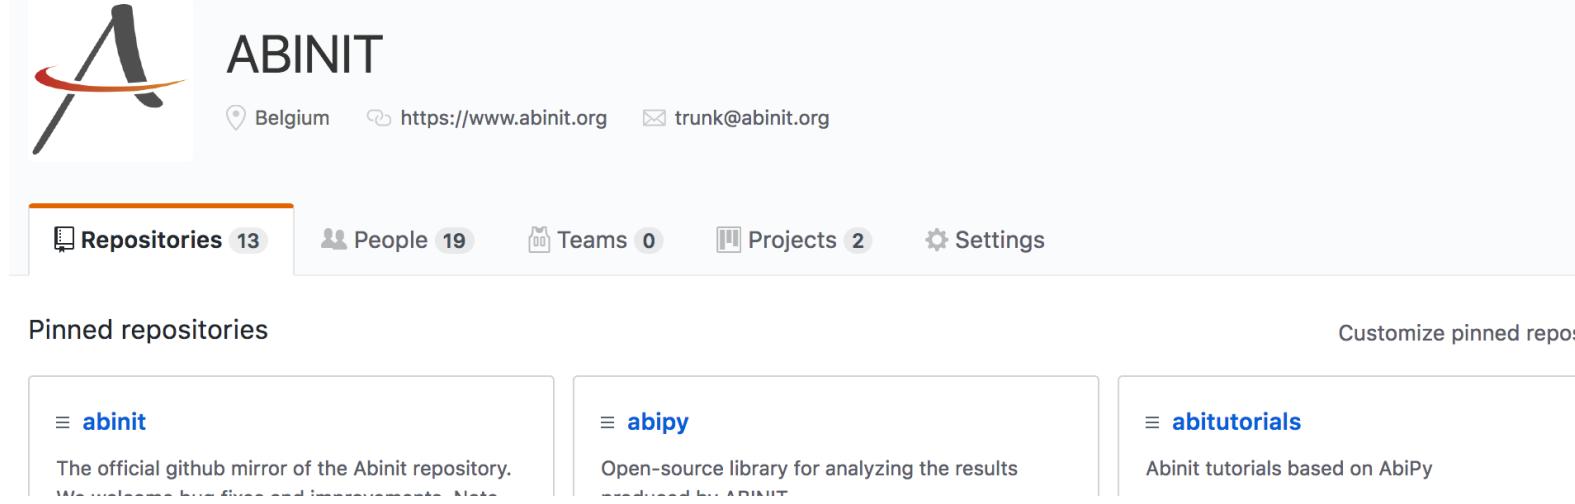

# ABINIT + python : Abipy, Abitutorials ...

ABINIT organization on GitHub <https://github.com/abinit>

Abipy : python library for launching ABINIT jobs,  
and analysing/plotting the results <http://pythonhosted.org/abipy>

=> e.g. connecting ABINIT with tools for high-throughput  
calculations developed in the Materials Project context  
(like Pymatgen, Fireworks).

Abitutorials : tutorial based on Jupyter notebooks ABINIT+python

The screenshot shows the GitHub organization page for ABINIT. At the top, there is a logo with a stylized 'A' and a red swoosh, followed by the text 'ABINIT'. Below the logo, there are links for location ('Belgium'), website ('https://www.abinit.org'), and email ('trunk@abinit.org'). A navigation bar below the header includes 'Repositories 13' (which is highlighted in orange), 'People 19', 'Teams 0', 'Projects 2', and 'Settings'. The 'Repositories' section shows a list of pinned repositories: 'abinit' (The official github mirror of the Abinit repository.), 'abipy' (Open-source library for analyzing the results produced by ABINIT), and 'abitutorials' (Abinit tutorials based on AbiPy). The 'abitutorials' repository is described as 'tutorial based on Jupyter notebooks ABINIT+python'. A 'Customize pinned repos' link is located in the top right corner of the pinned repositories section.

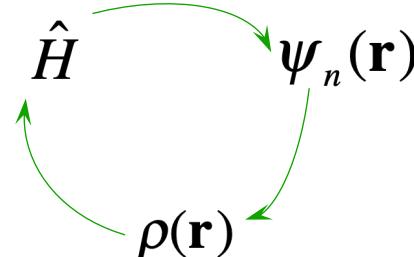

# ABINIT : basic concepts

- Density Functional Theory (DFT)
- Plane wave basis
- K-points
- Pseudopotentials

# Basic equations in DFT

Solve self-consistently the Kohn-Sham equation

$$\left\{ \begin{array}{l} \hat{H} |\Psi_n\rangle = \varepsilon_n |\Psi_n\rangle \\ \hat{H} = \hat{T} + \hat{V} + \hat{V}_{Hxc}[\rho] \\ \rho(\vec{r}) = \sum_n^{occ} \Psi_n^*(\vec{r}) \Psi_n(\vec{r}) \end{array} \right.$$

or minimize

$$E_{el}\{\Psi\} = \sum_n^{occ} \langle \Psi_n | \hat{T} + \hat{V} | \Psi_n \rangle + E_{Hxc}[\rho]$$

with

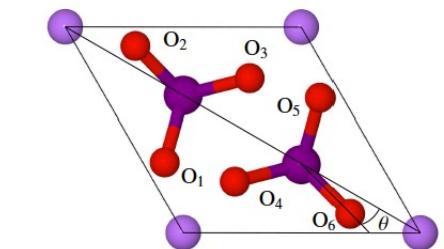

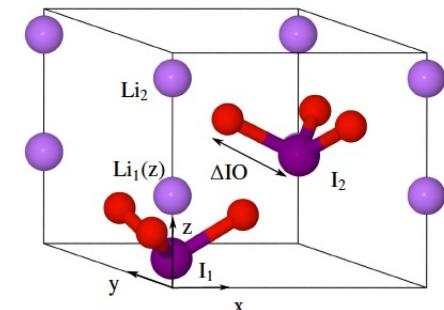

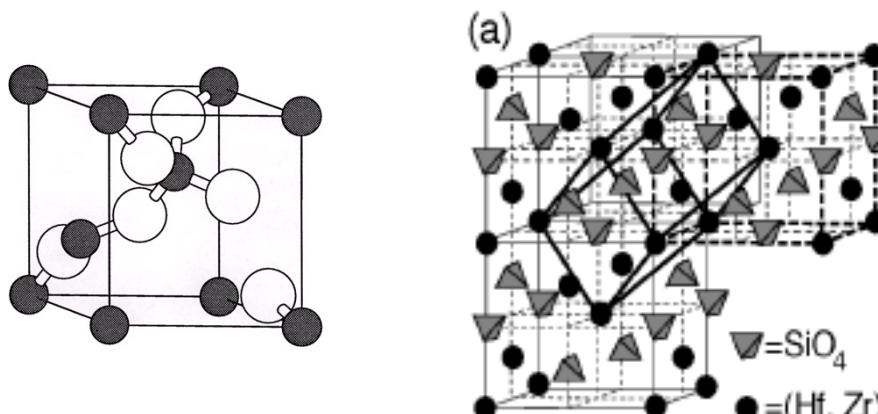

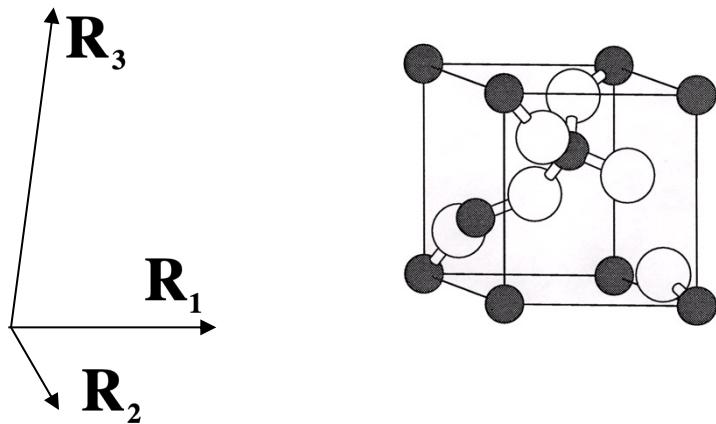

$$\hat{V}(\vec{r}) = \sum_{a\kappa} -\frac{Z_\kappa}{|\vec{r} - \vec{R}_\kappa^a|}$$

# Plane waves and periodicity

# ABINIT : a periodic code

Crystalline solids: Primitive vectors  $\mathbf{R}_j$ , primitive cell volume  $\Omega_0$

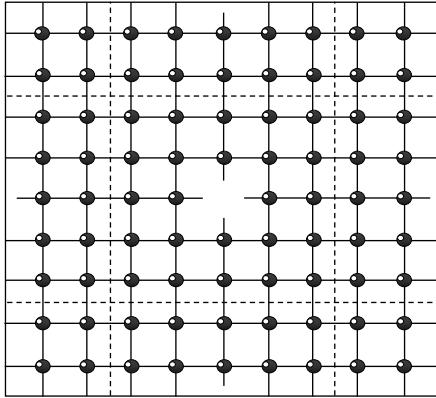

Need periodic boundary conditions.

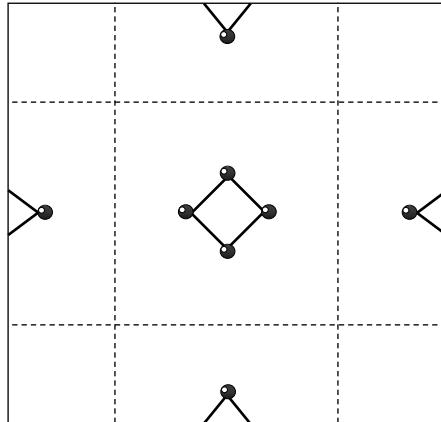

Plane waves  $e^{i\mathbf{K}\mathbf{r}}$  : particularly simple and efficient (when used with pseudopotentials), but infinite spatial extent.

# The supercell technique

For surfaces, defects, polymers, nanotubes, finite systems

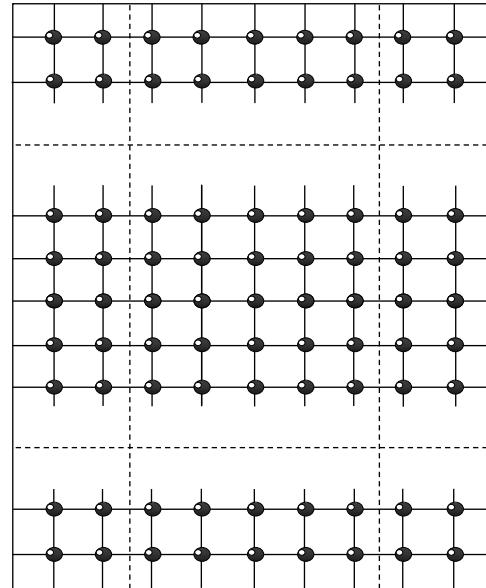

Point defect  
in a bulk solid

Molecule,  
cluster

Surface and interface:  
treatment of a slab

The supercell must be sufficiently big : convergence study

# The plane wave basis set

Periodic boundary conditions imply that

- The potential, the density, and the wavefunctions can be represented by a discrete Fourier series (plane waves)
- Wavefunctions are characterized by a **wavevector ( $\mathbf{k}$ )**

Plane waves representation of the wavefunctions:

$$\psi_{\mathbf{k}}(\mathbf{r}) = (N\Omega_0)^{-1/2} \sum_{\mathbf{G}} u_{\mathbf{k}}(\mathbf{G}) e^{i(\mathbf{k}+\mathbf{G})\mathbf{r}}$$

Selection of plane waves determined by a cut-off energy  $E_{\text{cut}}$  (**ecut**) which is a convergence parameter

$$\frac{(\mathbf{k} + \mathbf{G})^2}{2} < E_{\text{cut}}$$

Plane wave sphere

# Sampling the Brillouin zone

# From discrete states to Brillouin zone

Discrete summations over states (e.g. the density) :

$$n(\mathbf{r}) = \sum_i \psi_i^*(\mathbf{r}) \psi_i(\mathbf{r})$$

In the periodic case : summation over energy bands +  
integration over the Brillouin zone

$$n(\mathbf{r}) = \sum_n \frac{1}{\Omega_{0\mathbf{k}}} \int_{\Omega_{0\mathbf{k}}} f(\epsilon_F - \epsilon_{n\mathbf{k}}) \psi_{n\mathbf{k}}^*(\mathbf{r}) \psi_{n\mathbf{k}}(\mathbf{r}) d\mathbf{k}$$

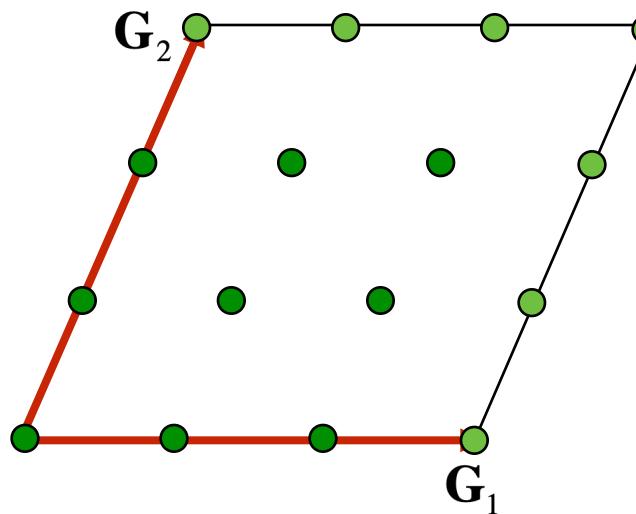

Discretize the BZ integration

$$\frac{1}{\Omega_{o\mathbf{k}}} \int_{\Omega_{o\mathbf{k}}} X_{\mathbf{k}} d\mathbf{k} \Rightarrow \sum_{\{\mathbf{k}\}} w_{\mathbf{k}} X_{\mathbf{k}} \quad [ \text{with } \sum_{\{\mathbf{k}\}} w_{\mathbf{k}} = 1 ]$$

Use **symmetries** to reduce the number of k-points  
and assign weights  $w_{\mathbf{k}}$

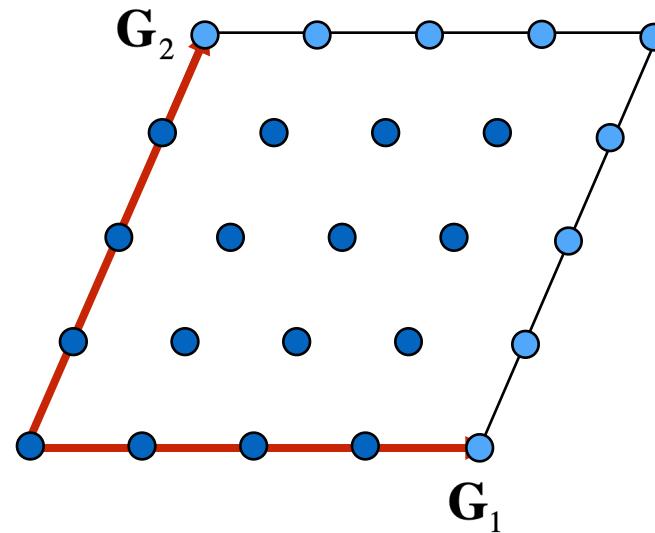

# BZ integration : Monkhorst-Pack grid

- Uniformly spaced grid of  $n_{k_1} \times n_{k_2} \times n_{k_3}$  points in the first Brillouin Zone  
[Monkhorst & Pack, Phys. Rev. B 13, 5188 (1976)]

$$n_{k_1} = n_{k_2} = 3$$

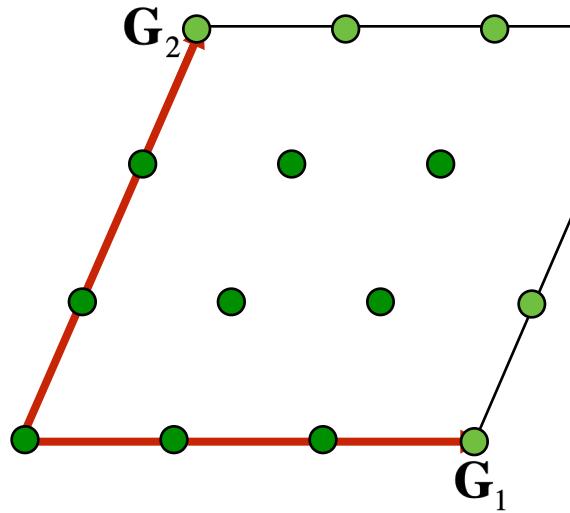

ngkpt nk1 nk2 nk3

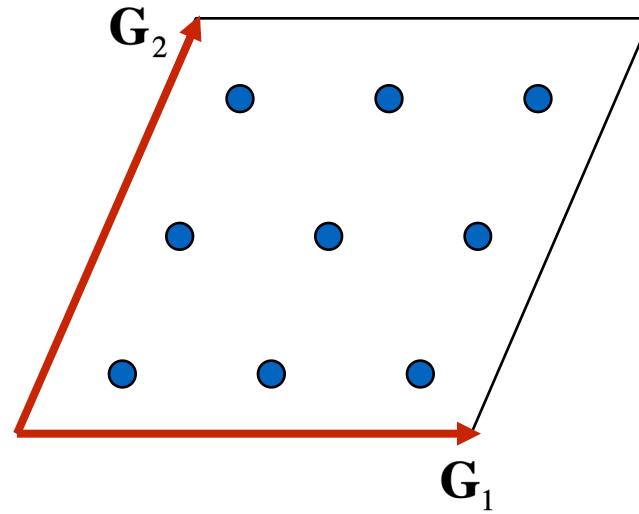

$$n_{k_1} = n_{k_2} = 4$$

# Unshifted and shifted grids

- k-points grid can be chosen to be shifted : not centered at  $\Gamma$ .
- Advantage : comparable accuracy can be obtained with fewer k-points in IBZ (especially for highly symmetric cases)

$n_{k1} = n_{k2} = 3$   
unshifted

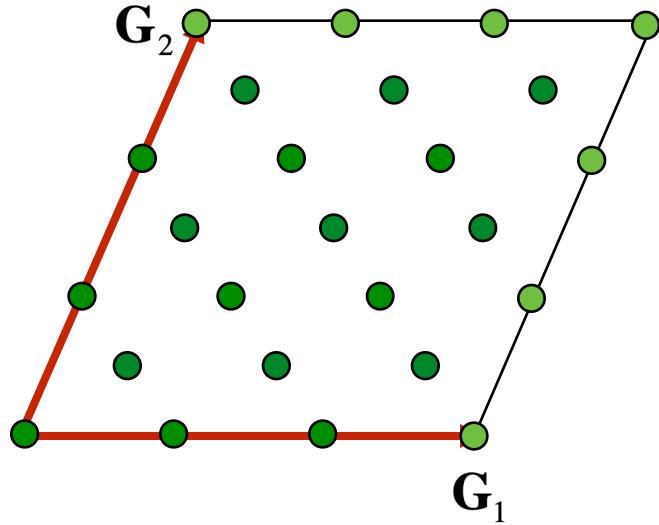

$n_{k1} = n_{k2} = 3$   
shifted by (1/2, 1/2)

ngkpt nk1 nk2 nk3  
shiftk sk1 sk2 sk3      (default: 0.5 0.5 0.5)

# Combining grids with various shifts

- k-points grid with various shifts can also be combined.

combining unshifted  
and shifted by  $(1/2, 1/2)$   
for  $n_{k1} = n_{k2} = 3$

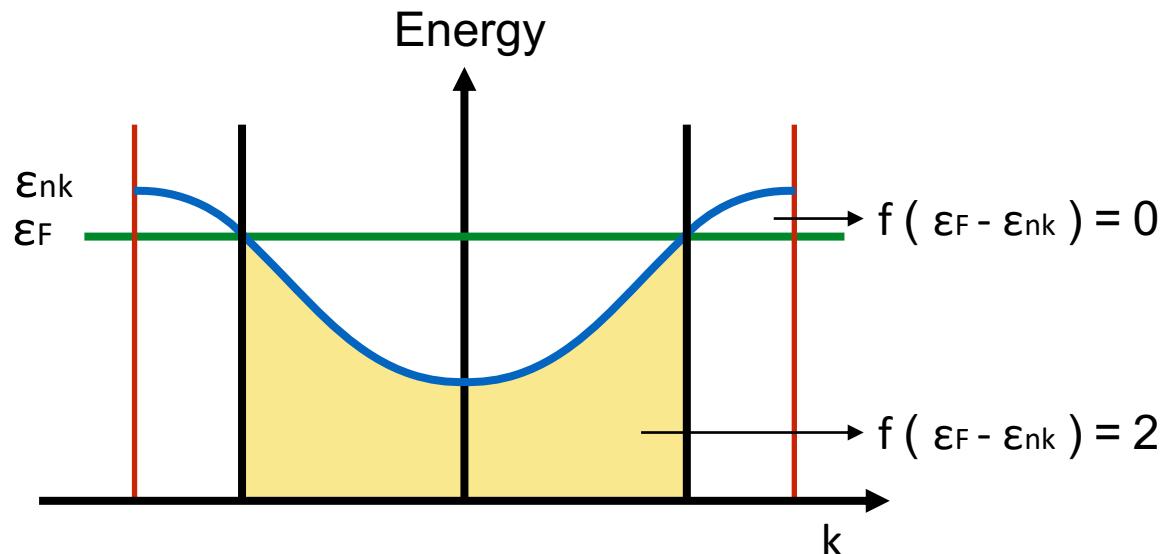

ngkpt	nk1	nk2	nk3
nshiftk	nsk		
shiftk	sk1(1)	sk2(1)	sk3(1)
	sk1(2)	sk2(2)	sk3(2)
...	...	...	...
	sk1(nsk)	sk2(nsk)	sk3(nsk)

# Treatment of metals

$$f(\varepsilon_{n\mathbf{k}}) = \frac{1}{1+e^{(\varepsilon_{n\mathbf{k}} - \varepsilon_F)/kT}}$$

*f* goes from 0 to 2 in an energy range  $\sigma = k_B T$

At  $T=0$ , occupation factor varies abruptly at the Fermi level  
=> Too many  $k$ -points needed to reach convergence!

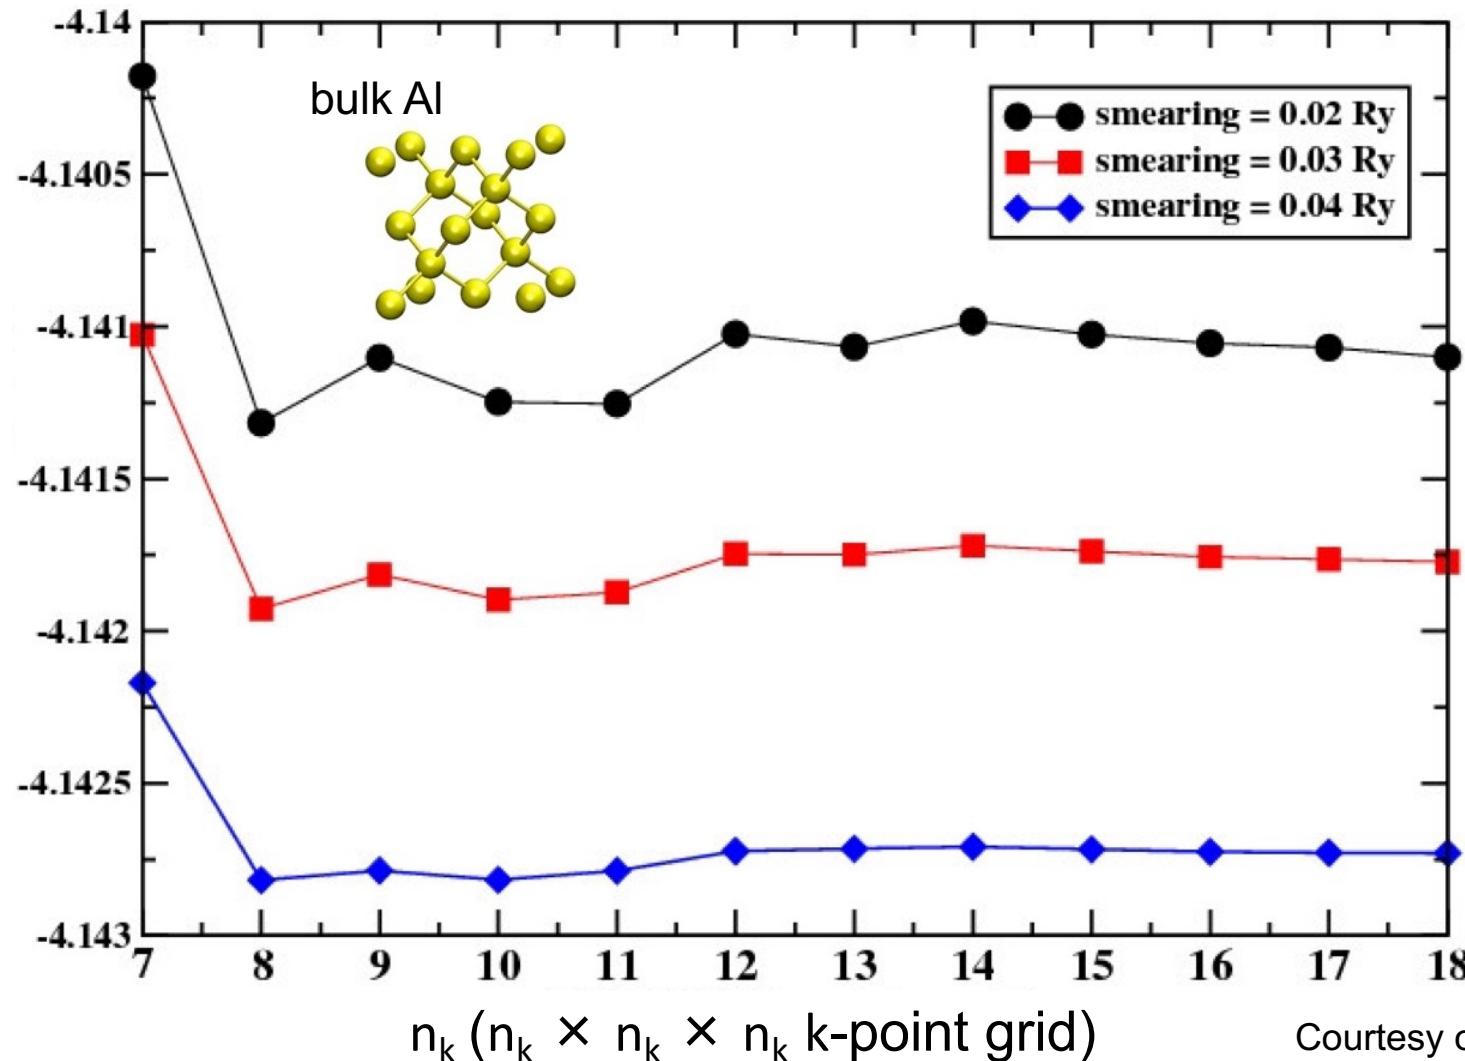

Solution: Use a **smearing scheme** with smearing temperature `tsmear`  $\sigma$

- Fermi-Dirac smearing (**inefficient**)      `occopt 3`
- Gaussian smearing (**recommended**)      `occ opt 7`
- Gauss-Hermite smearing      `occ opt 6`
- Cold Smearing      `occ opt 4/5`

# Convergence wrt k-points and smearing

Total energy (Ry)

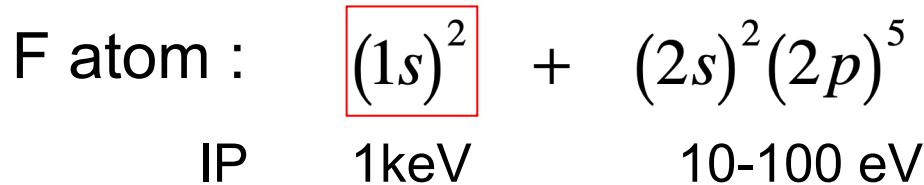

Courtesy of S. Narasimhan

# Pseudopotentials

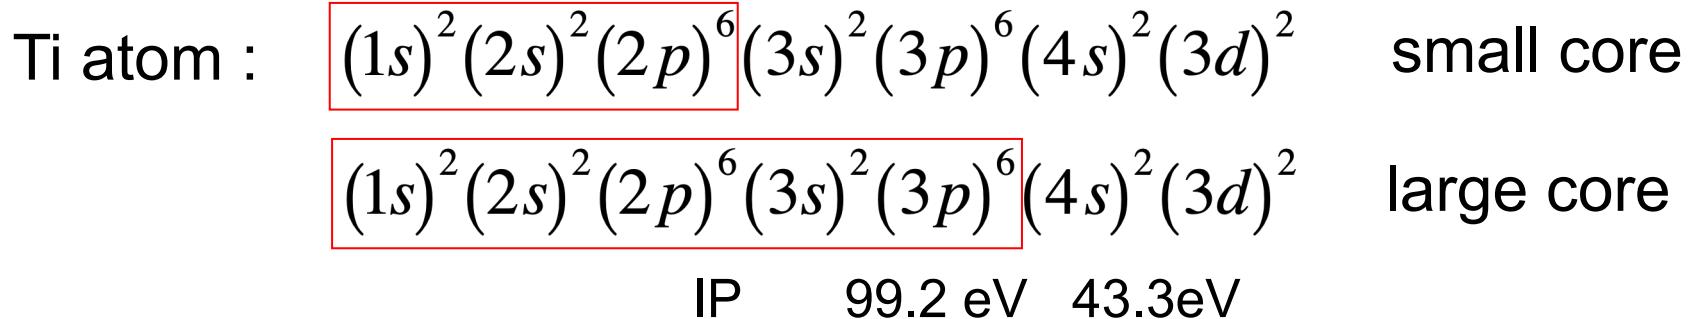

# Core / valence partitioning

Core electrons occupy orbitals that are « frozen » regardless of the atomic environment

For some elements, the core / valence partitioning is obvious.

For some others, it is not, and we have a choice to make!

Choice of partitioning will affect the accuracy of the calculation

# The concept of a pseudopotential

The potential of the nucleus + the frozen core electrons

Solving the Schrödinger equation with a pseudopotential produces a **pseudo-wavefunction** with the **same eigenvalues** as the valence electrons

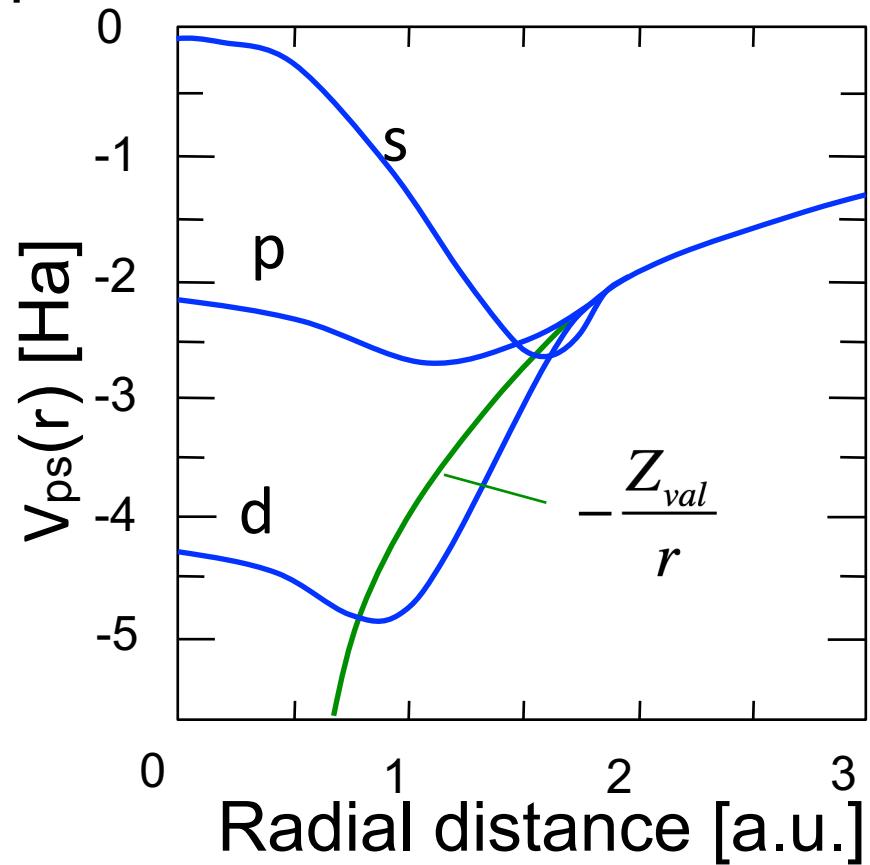

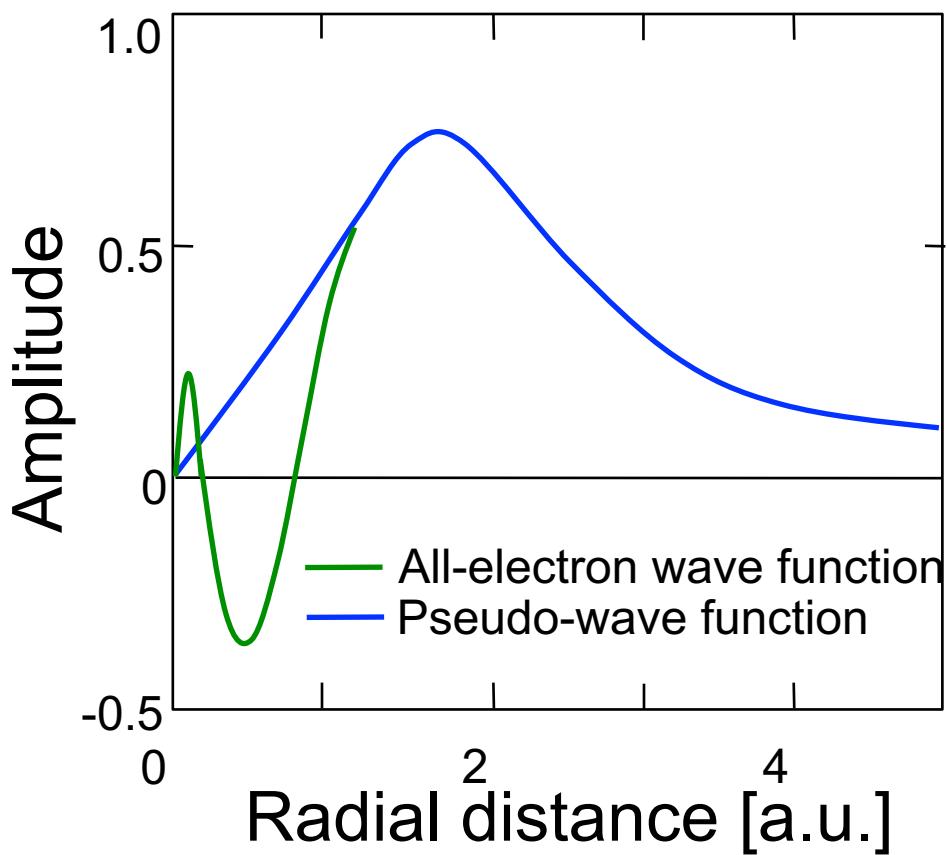

Has a cutoff radius  $r_c$  beyond which the pseudopotential corresponds to the real potential, and the pseudo-wavefunctions correspond to the real wavefunctions.

Different types of pseudos, depending on the constraints:

- Norm-conserving pseudopotentials (NCPP)
- Ultra-soft pseudopotentials (USPP)
- Projector-augmented plane waves (PAW)

# Example of pseudopotential

3s Radial wave function of Si

# Pseudopotentials/PAW data in ABINIT

- Norm-conserving pseudos : pseudo-dojo approach

Van Setten et al , Computer Physics Comm. 226, 39 (2018)

# Pseudopotentials/PAW data in ABINIT

- Preferred PAW atomic dataset table : JTH

*Jollet, Torrent, Holzwarth, Computer Physics Comm. 185, 1246 (2014)*

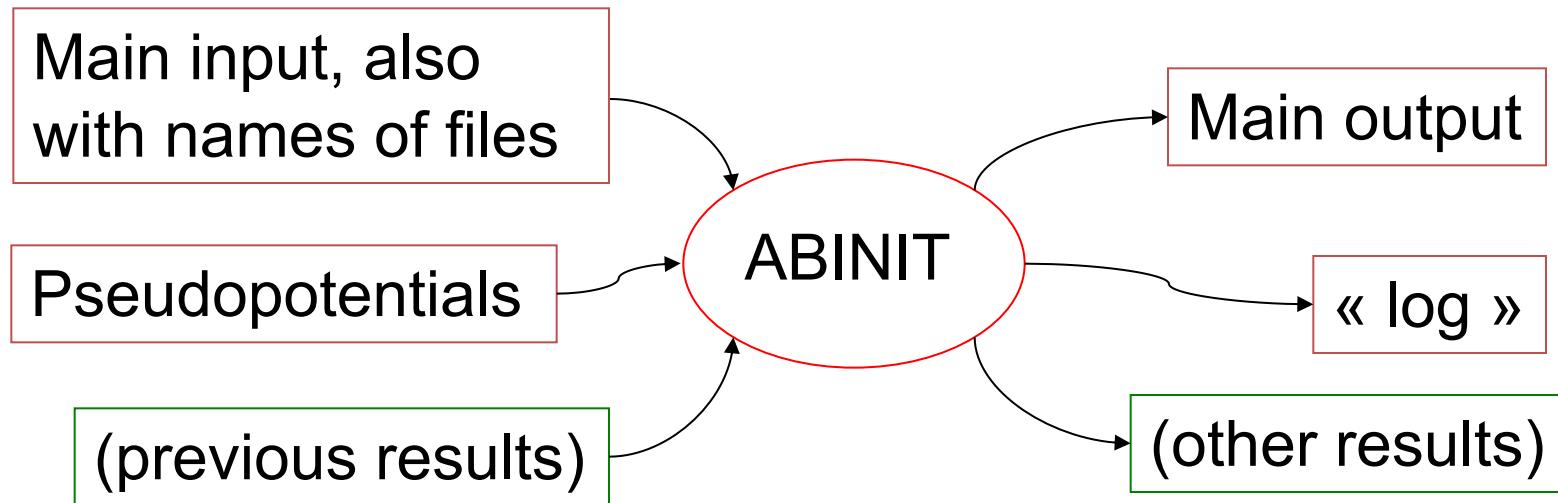

<https://www.abinit.org/psp-tables>

Also, possibility to use : GPAW table, GBRV v1.0 table, or norm-conserving pseudopotentials (e.g. ONCVPSP pseudo generator), or many others

# Running ABINIT : basics

# External files in a ABINIT run

Results :

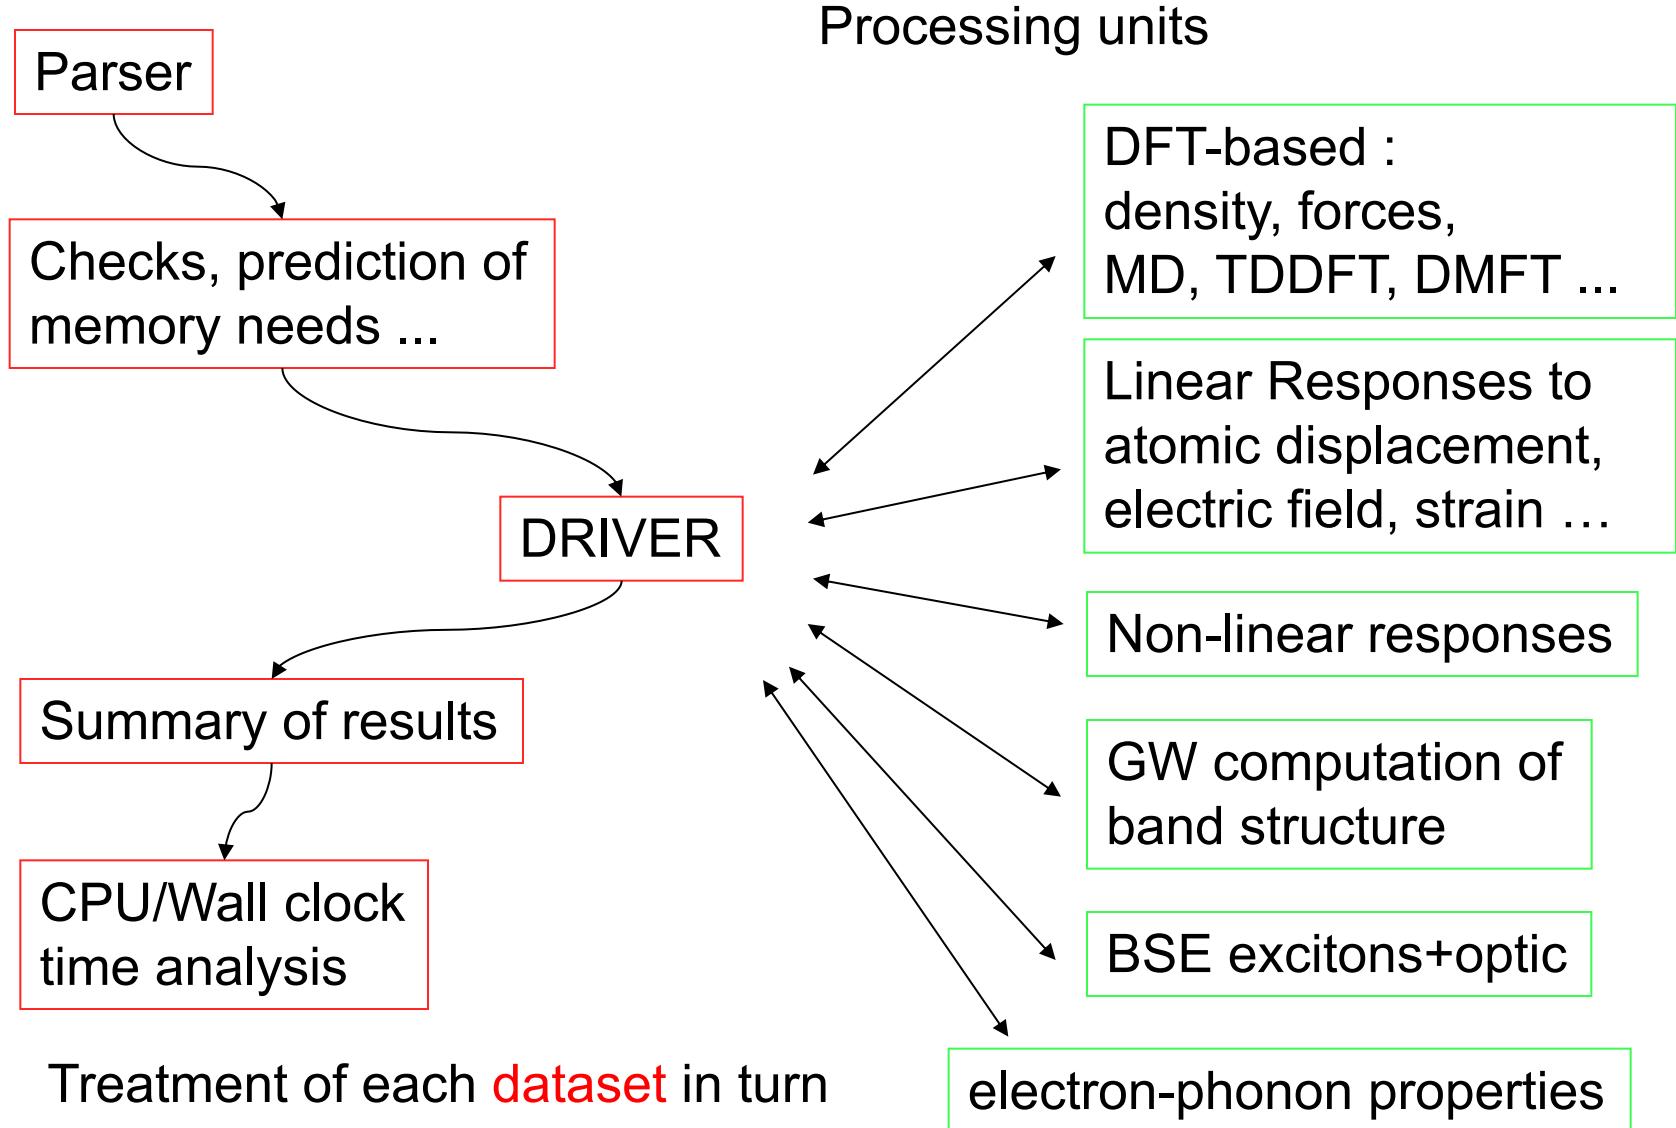

Text files : log, main output, energy derivatives ( `_DDB` ) ...

Binary F90 files : density ( `_DEN` ), potential ( `_POT` ), wavefunctions ( `_WFK` ), ...

netCDF files (similar to F90) : `_DEN.nc`, `_POT.nc`, `_WFK.nc`

Advantage of netCDF : portable, addressed by content, extensible, **Python-friendly**
